

## **Solar panel / wind turbines and water treatment system**

Energy is all around us: wind and solar can be used as power supply for our water treatment systems.

Lenntech can offer a combined water treatment and power supply system.

Lenntech works with hybrid power systems: a unique combination of wind turbines or solar panels with a modified diesel generator to deliver cheap electricity in remote areas for economic development.

The diesel generator is modified with patented technology and is placed into a container.

The main objective of the hybrid power system is to balance the power for electricity supply as wind energy or solar energy never remain stable, to ensure that at all times the electricity production meets consumer demand at a very high power quality.

Lenntech can develop customized systems to offer you the best and most appropriate water treatment solution powered by a solar or wind diesel power station.
